1. DATE 2 Jan 58		2. LOCATION Woodridge, England		12. CONCLUSIONS <input type="checkbox"/> Was Balloon <input type="checkbox"/> Probably Balloon <input type="checkbox"/> Possibly Balloon <input type="checkbox"/> Was Aircraft <input type="checkbox"/> Probably Aircraft <input type="checkbox"/> Possibly Aircraft <input checked="" type="checkbox"/> Was Astronomical Venus <input type="checkbox"/> Probably Astronomical <input type="checkbox"/> Possibly Astronomical <input type="checkbox"/> Other _____ <input type="checkbox"/> Insufficient Data for Evaluation <input type="checkbox"/> Unknown	
3. DATE-TIME GROUP Local _____ GMT 02/1740Z		4. TYPE OF OBSERVATION <input checked="" type="checkbox"/> Ground-Visual <input type="checkbox"/> Ground-Radar <input type="checkbox"/> Air-Visual <input type="checkbox"/> Air-Intercept Radar			
5. PHOTOS <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No		6. SOURCE Military			
7. LENGTH OF OBSERVATION 1 hr 15 mins		8. NUMBER OF OBJECTS one		9. COURSE stationary	
10. BRIEF SUMMARY OF SIGHTING Oval shaped, dull reddish-orange obj, size of grapefruit. Tremendous size for a star. Started moving, turned upon end w/what looked like 3 tail-like protrusions. At that point it seemed about 3 times larger. Obj moved slowly up and down, then to right & back to left, then down to orig position. All the time the obj grew dimmer, until it turned to an orange glow & disappeared.				11. COMMENTS It was the opinion of the AACS Tower operators & weather personnel on duty at the time of the sighting, that the obj could have been the planet Venus. ATIC concurs.

AIR INTELLIGENCE INFORMATION REPORT

FROM (Agency)	REPORT NO.	PAGE	2	OF	3	PAGES
79th Fighter Bomber Squadron						

The following information is submitted in compliance with AFR 200-2, 12 August 1954, Subject: UFOB.

- (1) (a) Oval shaped.
(b) Grapefruit.
(c) Dull reddish orange.
(d) One of three overlapping.
(e) Refer to (d) above.
(f) Refer to 2(d).
(g) Negative.
(h) Negative.
(i) Refer to 2(d).
- (2) (a) Tremendous size for a star.
(b) Southwest, 20 to 30 degree elevation.
(c) Approximately same as 2(b) above.
(d) Started moving at 1810Z, turned up on end with what looked like three tail-like protrusions. At that point it seemed about three times larger than original observation. The object did not speed up but moved slowly up and down, then to the right and back to the left, then downwards to the original position. All the time the object grew dimmer, until it turned to an orange glow, then disappeared.
(e) Refer to 2(d).
(f) 021740Z to 021815Z.
- (3) (a) Ground visual.
(b) Negative.
(c) Negative.
- (4) (a) 021740Z January 1958.
(b) Night.
- (5) IAF Station Woodbridge.
- (6) (a) Negative.
(b) [REDACTED] A/2C USAF, Det. 5, 603rd Communications Squadron teletype operator.
[REDACTED] A/2C USAF, Det 5, 603rd Communications Squadron.
[REDACTED] A/1C USAF, Det 5, 603rd Communications Squadron.
- (7) (a) No low clouds. Very few middle clouds. High thin Cirrus at 25,000 ft..
(b) East/North-east winds, 15 to 20 knots from surface to 15,000 feet.
West/North-west winds, 50 to 60 knots at 15,000 to 40,000 feet.
(c) Unlimited except for a few clouds at 24,000 feet.
(d) Unknown.
(e) Unknown.
(f) Negative.
- (8) Negative.
- (9) Negative.
- (10) The following type aircraft were in the area after 021700Z: Five F-86, One F-84-F and one L-20 aircraft.
- (11) There definitely was an unusually bright object sighted at the time indicated, however, it was the opinion of the AACCS Tower operators and weather personnel on duty at the time of the sighting, that it could have been the Planet Venus.

at the evening meal. I did not see them high in the south.

In a more extensive series, the following factors were studied: vegetation and the height of the figure stands. Among the factors, the most significant ($P < 0.05$) were:

Although only Venus is as bright as the evening, two other planets appear in the southeast before sunrise. Brightest of these is Jupiter, in the constellation of Virgo, the Virgin. It is close to the bright star Spica. However, it exceeds the star in brightness about ten times.

Further east is Mars, rising about an hour ahead of the sun. Its brightness is about half that of Spica. Mercury and Saturn are both too near the sun to be easily visible in November.

but in Pegasus itself, but in the neighboring group of Andromeda. This constellation represents the European princess who, according to mythology, was chained to a rock to be devoured by a sea monster, represented by the constellation of Cetus, the whale, in the south. Fortunately, she was rescued by the hero, Perseus, who is seen in the north-east.

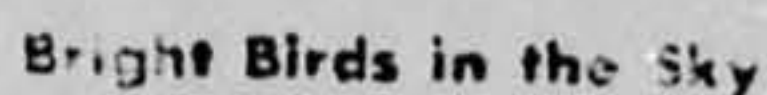

Andromeda's mother, Cassiopeia, is seen in the north, a group forming the letter M, above Polaris, the pole star. Alongside her is her husband, the king, Cepheus.

Turning now toward the east, we can see what is generally considered to be the finest constellation in the sky making its debut for the season.

This is Orion, the warrior, easily recognized because of the three stars in a row that form his belt. To the left is Betelgeuse, to the right is Rigel, both of the first magnitude, although being so low in the sky they do not appear as bright as they

November is the month bringing one of the year's famous showers of meteors, or "shooting stars," which appear from November 13th to the 16th.

They are most numerous after midday, because then we are on the backward side of the earth, it is almost impossible to resist the sun. Thus, we meet them again. This is different from the evening hours when we are on the forward part, and usually those that catch up to us.

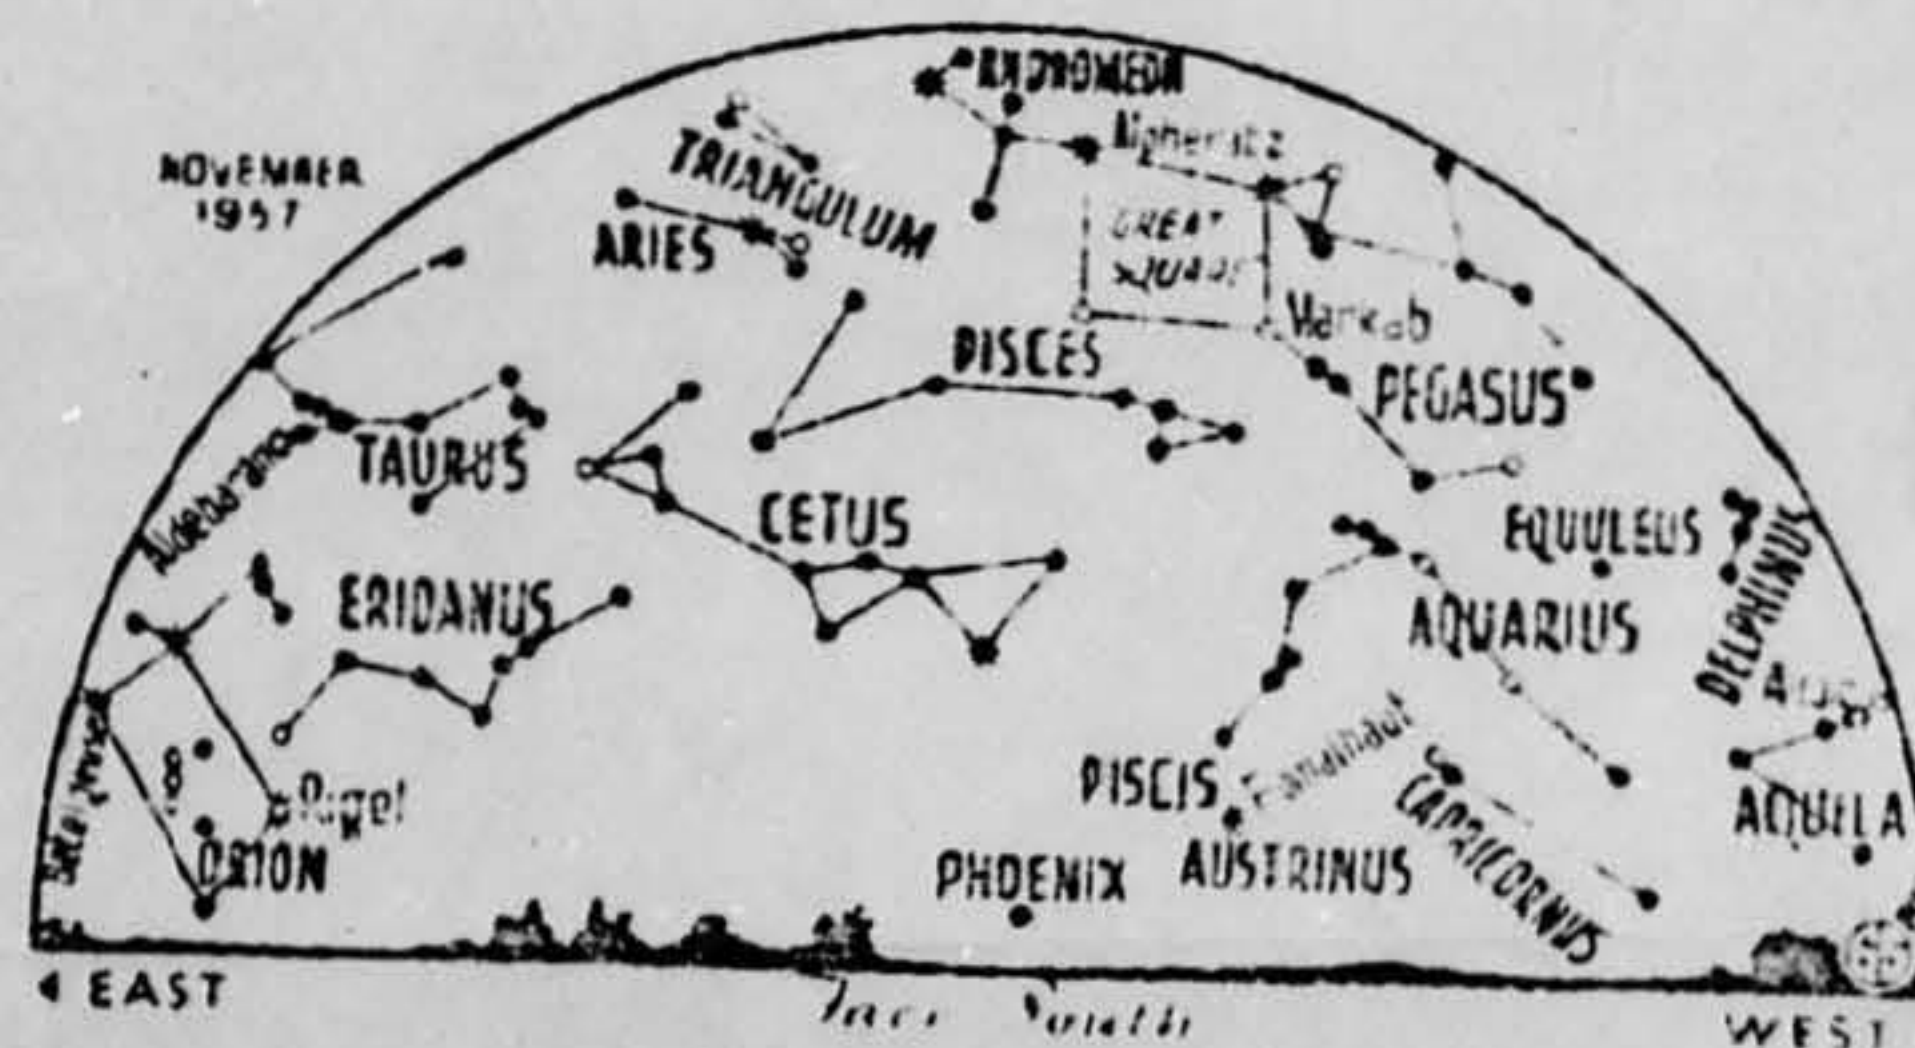

I have made the power show the stars
 of the new nation

Looking toward the western horizon, at the top of the "northern" cross, there is really part of the constellation of Orion, the hunter. He is in the bird's claw. In fact, the word is "Orion and his dogs." The crosspiece represents the wings, and the lower part of the cross has long since stretched forward in flight. At the head is Altair, a star of the second magnitude on the astronomical brightness scale. Betelgeuse is another first magnitude star, Vega, in Lyra, the lyre. For the feet is another bird, Aquila, the eagle, with the star Altair.

Look in the sky, and you can see the four stars that form the "great square," part of the constellation of Pegasus, the winged horse. Although these are not among the brightest, their characteristic arrangement makes them a good starting place from which to find other groups. The horse, actually, is upside down in the sky, as the row of stars extending westward from the lower right corner of the square is his head!

The spot at the upper right, Alpharatz, is
